The invention relates to a monoclonal antibody (MAb) to lipoteichoic acid of gram positive bacteria, where the MAb is a chimeric immunoglobulin comprising at least part of a human immunoglobulin constant region and at least part of a non-human immunoglobulin variable region having specificity to lipoteichoic acid of gram positive bacteria. The antibodies bind to whole bacteria and enhance phagocytosis and killing of the bacteria and enhance protection from lethal infection. The antibodies or peptides (encoded by a DNA of the variable region of anti-lipoteichoic acid antibody or characterised by amino acids corresponding to one or more of the complementarity determining regions (CDRs) of the variable region of the antibody) can be used for treating or preventing infections caused by gram positive bacteria. They can also be used for the diagnosis of gram positive bacteria infections.

Sequences AAW94705-22 represent sequences resulting from a 15mer library panning second experiment. Three series of panning experiments were conducted to identify peptide sequences of panning experiments were invention (Mab 96-110) bound strongly. The translated sequences provide lipoteichoic acid epitope peptide mimics to which Mab96-110 bound.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a monoclonal antibody (MAb) to lipoteichoic CC acid of gram positive bacteria, where the MAb is a chimeric immunoglobulin comprising at least part of a human immunoglobulin corporation and at least part of a non-human immunoglobulin variable constant region and at least part of a non-human immunoglobulin variable region having specificity to lipoteichoic acid of gram positive bacteria. The antibodies bind to whole bacteria and enhance phagocytosis and killing of the bacteria and enhance protection from lethal infection. The antibodies or peptides (encoded by a DNA of the variable region of cantibodies or peptides (encoded by a DNA of the variable region of corresponding to one or more of the complementarity determining regions (CDRs) of the variable region of the antibody) can be used for treating or preventing infections caused by gram positive bacteria. They can also be used for the diagnosis of gram positive bacterial infections.

CC sequences AAM94705-22 represent sequences resulting from a 15mer library panning second experiment. Three series of panning experiments were conducted to identify peptide sequences to which antibody of the invention (Mab 96-110) bound strongly. The translated sequences provide lipoteichoic acid epitope peptide mimics to which Mab96-110 bound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          QΥ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to novel peptides which bind to antibodies which crecognise the Toxoplasma gondii P30 envelop protein. A peptide library CC was generated to express pentadecapeptides on the surface of a CC filamentous phage as a fusion protein with the PIII protein The library CC was screened with immobilised anti-T. gondii P30 protein antibody lEIE7. CC phages which bind this antibody were recovered and supplified by one CC round of infection in E. coli. The resultant phages were rescreened with the immobilised antibody and the second round screen isolated 58 cancerial colonies antibody and the second round screen isolated 58 cancerial colonies was isolated and sequenced to determine the sequence of the pentadecapeptide encoded. The peptide sequences AAW12276-86 were CC identified. Of the 30 colonies studied, this peptide sequence was cencoded once. A template peptide sequence (AAW12287) corresponding to the sequence across the phage PIII sequence and putative pentadecapeptide was used to generate a series of overlapping corresponded corresponded. These peptides were used to determine the best pentadecapeptides. These peptides were used to determine the best corresponded once and putative the best corresponded once and putative the best corresponded once are the phage PIII sequence and putative the best corresponded to the phage pentades were used to determine the best corresponded once and putative the best corresponded once and putative the pentades are pentades and putative the best corresponded once and putative the best corresponded to the pentades and putative the penta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              H
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a monoclonal antibody (MAb) to lipoteichoic CC acid of gram positive bacteria, where the MAb is a chimeric comparising at least part of a human immunoglobulin comprising at least part of a human immunoglobulin variable constant region and at least part of a non-human immunoglobulin variable cregion having specificity to lipoteichoic acid of gram positive bacteria. CC The antibodies bind to whole bacteria and enhance phagocytosis and complete that infection. The cartibodies or peptides (encoded by a DNA of the variable region of cc anti-lipoteichoic acid antibody or characterised by amino acids corresponding to one or more of the complementarity determining regions cc (CDRs) of the variable region of the antibody) can be used for treating cc or preventing infections caused by gram positive bacteria. They can also be used for the diagnosis of gram positive bacteria infections.

CC Sequences AAW94705-22 represent sequences resulting from a 15mer library cc conducted to identify peptide sequences to which antibody of the convention (Mab 96-110) bound strongly. The translated sequences provide cc invention caid epitope peptide mimics to which antibody -110 bound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC Peptides AAW03367-75 are peptides isolated from a peptide library, which to antibody LELE? which recognises the P30 surface protein from CC Toxoplasma gondii. The peptide library was constructed by inserting a CC nucleic acid sequence encoding a random pentadecapeptide in the PIII CC envelop protein of a filamentous phage. Antibody LELE? was immobilised CC on the bottom of a Petri dish and the expressed peptide library was CC overlaid on the antibody. After washing, phages bound on the antibodies CC were recovered and the phage amplified by passage through E. coli. The CC phages were rescreened by the same method and 58 bacterial colonies were recovered. Of these, 30 were further studied and the nucleic acid cencoding the pentadecapeptide was isolated. The nucleic acids encoded CC the peptides AAW12287 was constructed to identify which peptide consequences bound to the anti-P30 antibody. The peptides canning isolated ceptides AAW03367-75. The peptides constructed to identify which peptide cassays to detect T. gondii antibodies in a sample or to purify anti-P30 antibodies in a sample or to purify anti-P30 cantibodies in a sample or to purify anti-P30 antibodies in a sample or to purify anti-P30 antibodies in a sample or to purify anti-P30 cantibodies in a sample or to purify anti-P30 antibodies in a sample or to purify anti-P30 cantibodies in a sample or to purify anti-P30 antibodies in a sample or to purify anti-P30 antibodies in a sample or to purify anti-P30 antibodies canning the page to the page to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

```

Peptides AAW03367-75 are peptides isolated from a peptide library, which bind to antibody IELE7 which recognises the P30 surface protein from Toxoplasma gondii. The peptide library was constructed by inserting a nucleic acid sequence encoding a random pentadecapeptide in the PIII envelop protein of a filamentous phage. Antibody IELE7 was immobilised on the bottom of a Petri dish and the expressed peptide library was overlaid on the antibody. After washing, phages bound on the antibodies

The phages were rescreened by the same method and 58 bacterial colonies were recovered. Of these, 30 were further studied and the nucleic acid encoding the pentadecapeptide was isolated. The nucleic acids encoded the peptides AAW12276-86. A series of overlapping peptides based on the peptide template AAW12287 was constructed to identify which peptide sequences bound to the anti-P30 antibody. The peptide scanning isolated peptides AAW3367-75. The peptides can then be used in diagnostic assays to detect T. gondii antibodies in a sample or to purify anti-P30 antibodies or for active immunisation against T. gondii.
The present sequence is the protein sequence for a human cytoskeleton-associated protein (CSAP). The CSAP and its coding sequence are useful in the diagnosis, treatment and prevention of a cell proliferative disorder such as actinic keratosis, atherosclerosis, psoriasis, primary thrombocythaemia, leukaemia; a viral infection such as
                                                                                                                                                                                                                                                                                                                                                                                                                                        Warren

```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC AAW24520) of mouse anti-human Factor IX monoclonal antibody BC2.
CC Claimed humanised antibodies (see AAW24510-18) contain CDRs (see
CC AAW24504-99) of BC2 heavy and light chains inserted into framework
CC regions of selected human antibody sequences. They have self-
CC limiting neutralising activity, and are useful as anticoagulant
CC agents in treatment of thrombosis associated with myocardial
CC infarction, unstable angina, atrial fibrillation, stroke, renal
CC damage, pulmonary embolism, deep vein trombosis, percutaneous
CC transluminal coronary angioplasty, disseminated intravascular
CC coagulation, sepsis, or artificial organs, shunts or prostheses
CC (claimed). Also claimed are chimeric antibodies (see AAT79900), and
CC Fab and F(ab') 2 fragments. The claimed antibodies do not cause
CC uncontrolled bleeding (contrast heparin and warfarin) since they
CX
C provide only partial inhibition of coagulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                               rne invention relates to a method for treating an animal post-thromboembolic induced ischaemia or reducing a required dose of a thrombolytic agent in treatment of an animal post-thromboembolic induced ischaemia, comprising administering an anti-factor IX antibody or its fragment, optionally in combination with a plasminogen activator or thrombolytic agent. The method is useful for treating post-thromboembolic-induced ischaemia, for preventing thromboembolic stroke in an animal, and for reducing a required dose of a thrombolytic agent. Sequences ABK23932-ABK24009 represent DNA molecules encoding antibodies and PCR primers used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Treating post-thromboembolic induced ischaemia in an animal administering anti-factor IX antibody in combination with a

The plasmid includes the murine dihydrofolate reductase (DHFR) components that it is considered that the Escherichia coli beta-galactosidase gene, baculovirus coling, a cassette comprising the promoter and enhancer elements from cytomegalovirus and SV40 virus, the E. coli beta-glucuronidase (GUS) gene, firefly luciferase gene, Salmonella typhimurium histidinol dehydrogenase gene (HiSD) and transposon This neomycin phosphotransferase (neo) gene sequences, in a pBR-derived backbone, and also an anti-B cell antigen CD20 chimeric antibody C2B8 gene. The invention provides a novel method for integrating a desired exogneous DNA at a target site within the genome of a mammalian cell via homologous recombination. This involves transfecting the contains a unique sequence that is foreign to the mammalian cell genome and which provides a substrate for homologous recombination, the transfection with a 'target plasmid', such as Wolly or Mandy (see AN61794), containing a sequence which provides for homologous recombination with the unique sequences contained in the mammalian cells, typically an immunoglobulin or other secreted mammalian glycoprotein. The homologous recombination system utilises the new cene as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          nmunoguoputi of order system utilises the neo gene as a compologous recombination system utilises the neo gene as a series of the neo gene is split into 3 of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ite specific integration of DNA in mammals for expressing, .mmunoglobulins - comprises homologous recombination using selectable marker and target plasmids.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 В
Chemokinetic; proliferative; immunomodulatory, haematopoietic; chemokinetic; analgesic; haemostatic; thrombolytic; antiinflammatory; Cytostatic; antibacterial; antifungal; antiviral; antidiabetic; antibacterial; antifungal; antiviral; antidiabetic; cantiasthmatic; vulnerary; antiulcer; osteopathic; neuroprotective; Conotropic; antiparkinsonian; antipsoriatic; cerebroprotective; anticonvulsant; and antidepressant. The sESTs can be used for gene contemps and in vaccines. The sESTs are useful as probes for the contemps and in vaccines of tull-length cDNAs and genomic DNA concludes which correspond to the sESTs. Proteins encoded by the sESTs care useful in assays for determining biological activity and raising cantibodies. They may be useful for treatment of autoimmune disorders (multiple sclerosis, insulin dependent diabetes), allergic conditions (sthma), myeloid or lymphoid cell deficiencies, wounds, burns, ulcers, costeoporosis, osteoarthritis, central nervous system disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 W Human; mouse; chicken; rat; secreted expressed sequence tag; sEST;

The specification describes a method for producing an communoglobulin (Ig) G/IgG dimer. The method comprises genetically CC engineering a monoclonal antibody to introduce a cysteine molecule CC which inhibits formation of intramolecular disulphide bridges between CC sister heavy chains on the same antibody molecule. The dimer is a CC homodimer or heterodimer that is capable of activating components of the CC complement system, and has the ability to activate and kill cells via the CC complement cascade. The dimer is also capable of binding to Fogamma CC creeptors on cytotoxic effector cells and on host immune cells, and is CC capable of initiating programmed cell death. The IgG/IgG dimers may be CC used to treat allergic disorders, cancers and autoimmune diseases such as allergic bronchopulmonary aspergillosis, allergic CC rhinitis, atopic dermatitis, Crohn's disease, Graves's disease, food CC allergies, allergic contact dermatitis, CLL cancers and/or B-cell CC unphomas. They may also be used to treat a range of other diseases and CC disorders such as rheumatoid arthritis, ulcerative colitis, psoriasis, CC pigeon breeder's disease, hepatitis, leprosy. Lyme disease, diabetes mellitus, candidiasis and aplastic anaemia. They are also useful for CC inducting hyper-cross-inking of membrane antigens and for the

TCAE8, a gene encoding a chimeric anti-CD20 antibody for treatment of B cell lymphomas. TCAE8 contains 4 transcriptional cassettes, human Ig light and heavy chain constant regions, dihydrofolate reductase, neomycin phosphotransferase and murine variable regions. The vector can be used to produce

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1284
                                                                                                                                                                                                                                                                                                                                                                                                                 This cDNA sequence encodes a mouse-human chimeric antibody light chain (AAW24532) in which the variable region is derived from mouse anti-human factor IX monoclonal antibody BC2 cDNA (see AAT79899) and human sequences from the immunoglobulin RF-TS3'CL framework. It was obtained by PCR amplification (see AAT79897-98) of BC2 cDNA and insertion of the PCR product into P9HZHC 1-3 cDNA of SC2 cDNA and insertion of the PCR product into Typication (see AAT77374). Claimed anti-Factor IX chimeric antibodies are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Chimeric synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                    The invention relates to a method for treating an animal post-thromboembolic induced ischaemia or reducing a reguired dose of a thrombolytic agent in treatment of an animal post-thromboembolic induced ischaemia, comprising administering an anti-factor IX antibody or its fragment, optionally in combination with a plasminogen activator or thrombolytic agent. The method is useful for treating thromboembolic-induced ischaemia, for preventing thromboembolic stroke in an animal, and for reducing a required dose of a thrombolytic agent. This cDNA sequence was obtained by PCR amplification (see AAT79897 and AAT79898) of the light chain variable region (see also AAT77377) of mouse anti-human factor IX monoclonal antibody BC2 cDNA. The amplification resulted in the addition of ScaI, NarI ends to the VL region. The PCR product was ligated into ScaI, NarI-digested F9HZHC 1-3 (see AAT77374) and digested with ScaI, NarI to produce a mouse-human chimeric light chain F9CHLC (see AAT79900, AAR74532). Claimed anti-Factor IX chimeric antibodies are useful in the

The method is useful for treating post-thromboembolic-induced ischaemia, for preventing thromboembolic stroke in an animal, and for reducing a required dose of a thrombolytic agent. Sequences ABK23932-ABK24009 represent DNA molecules encoding antibodies and PCR primers used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                The patentors claim a chimeric antibody molecule comprising 2 lig chains and 2 heavy chains, each comprising a constant human region and a variable non-human region. Coding sequences for the Ig cha are also claimed. The invention provides consensus sequences of light and heavy chain J regions useful in the design of oligonucleotides (UIGs) for use as primers or probes for cloning immunoglobulinlight or heavy chain mRNAs or genes. Depending on nature of design of a particular UIG, it may be capable of hybridizing to all Ig mRNAs or genes containing a single specific sequence. UIG denotes universal immunoglobulin gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Prodn. of immunoglobulin chains and molecules - is by recombinant DNA procedures, with chimeric antibodies etc. related to cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CDS
